Ceylonry POS Complete System Guide

A step-by-step explanation of the full POS workflow, available features and day-to-day operation.

ONE FLEXIBLE SYSTEM	FOR MULTIPLE BUSINESS TYPES
Checkout, orders, products, stock, customers, staff, receipts and reports.	Restaurant, cafe/bakery, retail, grocery, salon/spa, pharmacy, services and custom businesses.

15-day free trial | Manual bank-transfer billing | Monthly and annual options

What Ceylonry POS Does

Ceylonry POS is a shared point-of-sale platform for businesses that sell products, services or both. A business preset provides useful starting categories without restricting future customization. All businesses continue to use the same checkout, customer, staff, payment and reporting architecture.

Core capabilities

- Product and service checkout with category browsing and search.
- Cash, card, bank transfer, online, gift-card, third-party and split-payment recording.
- Saved orders, order recall, receipts, refunds, voids and cash-register reconciliation.
- Products, service items, modifiers, stock, recipes, customers, CRM and reports.
- Role-based staff access, PIN sign-in, attendance, breaks and staff commissions.
- Appointments and memberships for service businesses; prescription and batch/expiry records for pharmacies.
- Responsive operation on desktop, laptop, tablet and mobile screens.

Step 1: Create the business account

The client registers the business using their name, business name, email and password. The account begins with a 15-day free trial. After business authentication, individual staff members enter the register with their own PIN.

Step 2: Choose the business preset

The owner opens guided setup and selects the closest business type. The system merges the relevant default categories without deleting existing data or creating duplicates.

- Restaurant: Starters, Main Courses, Sides, Desserts, Drinks and Add-ons.
- Cafe / Bakery: Coffee, Tea, Cold Drinks, Pastries, Cakes, Bakery, Food and Add-ons.
- Retail: Clothing, Accessories, Electronics, Beauty, Home and General.
- Grocery: Grocery, Fresh Produce, Drinks, Household, Personal Care, Frozen and Other.
- Salon / Spa: Hair, Nails, Skincare, Facial, Massage, Treatments, Packages and Products.
- Pharmacy: Medicines, Personal Care, Wellness, Baby Care, Medical Supplies and Other.
- Services: Services, Packages, Add-ons and Products.
- Other: no categories are forced; the business builds a fully custom catalogue.

Presets are starting configurations only. Custom products, services, modifiers and categories remain available after setup.

Step 3: Configure the business profile

In Settings, enter the business name, email, address and logo. Configure the receipt footer, business type, printer, feedback link and number of POS users. These details appear throughout the POS and on applicable receipts.

Step 4: Manage categories

Settings provides a category manager. Add a category, rename it or delete it when no longer needed. Configured categories appear immediately in Checkout. Deleting a used category preserves its products by moving them to Uncategorized.

Step 5: Add products and services

Open Products & Services and select Add Item. Record the name, item type, product code, category, cost price, selling price, image, modifiers and recipe/stock usage. The system calculates margin from cost and selling price.

Step 6: Create modifiers and add-ons

Use Modifier Groups for choices such as sizes, flavours, toppings, milk options or service extras. Options may add a price, be required or optional, and be assigned only to relevant items.

Step 7: Set up inventory

Add ingredients, sellable products, packaging or supplies in Inventory & Stock. Record SKU, unit, current quantity, reorder level, unit cost and supplier. Stock adjustments cover receipts, corrections, wastage, damage, internal use and supplier returns. Recipes connect products to stock usage.

Step 8: Add customers

Create customers from the directory or during checkout. Store name, mobile, email, birthday and notes. Search by mobile number at checkout or use Walk-in Customer. The system tracks visits, lifetime value, average spend, last visit and favourite item.

Selling and Order Management

Step 9: Complete a normal sale

Open Checkout, choose a category, select products or services, complete modifier choices and adjust quantities. Select a customer if required, apply an authorised discount, choose payment and complete the sale. The transaction is added to sales history and reporting.

Step 10: Record payment

Choose Cash, Card, Bank Transfer or Online Payment for a standard sale. Split payment also supports Gift Card and Third Party. Cash requires an open register so expected drawer cash remains accurate.

Step 11: Split the bill

Select Split Bill, divide the total between two, three or four people or add custom portions. Choose a payment method and amount for each portion. The POS verifies that every portion is positive and the allocation equals the order total.

Step 12: Save and recall an order

Any applicable business can add items, enter an order reference and select Save Order. Open Order Queue later, choose Open / Pay, update the order and complete payment. Standard businesses see Saved and Awaiting Payment statuses.

Step 13: Use restaurant and cafe kitchen tools

Restaurant and Cafe / Bakery presets additionally show Send to Kitchen. They support table/order references, open orders, kitchen sending, resend and Kitchen Order Ticket printing. A KOT contains quantities, items and modifiers but excludes customer prices. Automatic KOT printing and a kitchen-printer route can be configured.

Step 14: Apply discounts and memberships

Checkout supports percentage and fixed discounts. Salon/Spa and Service businesses can create customer memberships with a name, discount, start/end date and status. When an active member is selected, staff can apply the membership discount to the order.

Step 15: Schedule appointments

Salon/Spa and Service businesses use Business Tools to create appointments. Select customer, service, date/time and staff member, then add notes. Track Booked, Confirmed, Completed, Cancelled and No-show statuses from the daily appointment calendar.

Step 16: Calculate staff commissions

Owners or managers set a commission percentage for each staff member. Select a date range to review eligible completed sales, calculated commission, recorded payments and outstanding balance. Mark Paid creates an auditable commission-payment record.

Step 17: Record pharmacy prescriptions

Pharmacy accounts can create a prescription record with customer, date, reference, prescriber, medicine/instructions and status. Statuses are Pending, Partially Fulfilled, Fulfilled and Cancelled.

Step 18: Track medicine batches and expiry

Select an inventory item and record batch number, quantity, received date, expiry date and supplier. Pharmacy KPIs identify current, expiring-soon and expired batches. Batch tracking complements the standard inventory workflow.

Operations, Staff and Client Communication

Step 19: Issue receipts

After checkout, print a receipt, automatically print after sale, email it, prepare a WhatsApp receipt or reprint a previous receipt. Receipts can include business branding and a custom footer. Printer settings support the system printer, paired USB/Bluetooth devices and configured Epson network printers.

Step 20: Handle refunds and voids

Authorised staff can process full or partial refunds and void sales from Sales History. Reasons and statuses are retained. Split-payment refunds preserve the payment breakdown. Cash refunds require an open register.

Step 21: Manage users and roles

Create staff with a name, unique 4-6 digit PIN, status and role. Owner has full access; Manager manages operations; Accountant focuses on financial review; Cashier focuses on checkout, customers and their shift. Deactivating a user preserves historical activity.

Step 22: Track attendance

Staff sign in with their PIN, Clock In, start/end breaks and Clock Out. The POS records timestamps, total working time and break duration. Staff must close their cash register before clocking out.

Step 23: Reconcile the cash register

Clock in, open the register and enter opening cash. The system adds cash sales and subtracts applicable refunds/voids. At closing, enter actual cash; the POS calculates expected cash and the shortage or overage.

Step 24: Use CRM and feedback

The CRM identifies VIP, frequent, inactive and birthday customers, lifetime value and feedback due. Prepare WhatsApp greetings, rewards or feedback messages; the business reviews the prepared message before sending.

Step 25: Review sales history

Search by receipt, customer, mobile or payment method. Review transaction details and statuses, reprint receipts, process authorised actions and export sales to CSV.

Step 26: Review dashboard and reports

Use Today, This Month or a custom range. Review transactions, revenue, costs, gross profit, gross margin, best sellers, payment methods, customer sales, repeat customers, staff hours, breaks and register variance. Export report data for owners or accountants.

Step 27: Enable controlled support

The owner can generate a time-limited support code. Diagnostic support sessions are read-only and audited; checkout, refunds and business-record changes are disabled.

Step 28: Complete subscription payment

When billing is due, compare Monthly and Annual options in the popup, select the preferred cycle and transfer the displayed amount. Upload a PDF, PNG, JPG or WebP payslip up to 3 MB. The system records the cycle and amount, sends the slip to accounts, calculates the next due date and restores access while review is completed.

Billing uses manual bank transfer. The current POS does not automatically debit a card or bank account.

Quick Daily Workflow

	Sign into the business, enter the staff PIN, clock in and open the cash register with the opening balance.
	Choose items, customer and modifiers; apply authorised discounts; save the order or complete payment.
	Use appointments/memberships for service clients, or KOT/open-order tools for restaurants and cafes.
	Monitor stock, batches, sales history, refunds, customer activity and staff commissions.
	Close the register, count cash, review variance, clock out and check the dashboard/reporting summary.

System boundaries

- All presets use one shared POS architecture; there are no duplicate industry systems.
- Automatic card or bank debit requires a separately configured payment provider and merchant credentials.
- Prescription records support operational tracking and do not replace professional clinical or regulatory processes.
- Printer operation depends on correct device pairing or network connectivity.

Ceylonry POS combines checkout, orders, stock, customers, staff and reporting with flexible industry tools - giving the client one adaptable system as the business grows.
